EEB 324: Theoretical Ecology (TA: Marissa Baskett)
Useful Matlab commands

| Basics |  |
| :---: | :---: |
| $\begin{array}{r} \text { help functionNar } \\ +-* / \\ .^{*} \cdot / \\ \mathrm{x}= \\ \mathrm{x}= \\ \sin (\mathrm{x}), \cos (\mathrm{x}), \tan \\ \exp (\mathrm{x}), \underset{\log (\mathrm{x}), \log 10}{\operatorname{abs}(\mathrm{x}), \operatorname{sqrt}}( \end{array}$ | Get quick help on function functionName; you can also use the Help menu <br> Simple addition, subtraction, multiplication, division, and power <br> Element-by-element multiplication, division, and power for vectors and matrices (e.g., $[1,2] . *[3,4]=[3,8]$ ) <br> Assign the value 4 to x <br> Assign 4 to x without reporting back <br> sine, cosine, and tangent <br> exponential, natural log, base-10 log <br> Absolute value, square root |
| Vectors |  |
| $\begin{array}{r} \mathrm{v}=1: 1 \\ \mathrm{v}=1: 0.5: 1 \\ \mathrm{v}=[1,3,8 \\ \mathrm{v}(3 \\ \mathrm{v}(\mathrm{end} \\ \operatorname{length}(\mathrm{v} \\ \operatorname{sum}(\mathrm{v} \end{array}$ | A vector from 1 to 10 in increments of 1 A vector from 1 to 10 in increments of 0.5 A vector with values $1,3,8$ <br> Third element of vector v Last entry in vector v Length of vector v <br> Sum of all entries in vector v |
| Matrices |  |
| $\begin{array}{r} \mathrm{M}=[12 ; 34 \\ \mathrm{M}(1,: \\ \operatorname{size}(\mathrm{M} \\ \text { zeros }(2,3), \text { ones }(2,3 \\ \operatorname{eye}(3 \\ \operatorname{sum}(\mathrm{M} \\ \operatorname{det}(\mathrm{M} \\ \operatorname{trace}(\mathrm{M} \\ \mathrm{M} \\ \text { evals }=\underset{\operatorname{eig}(M)}{\mathrm{ein}}(\mathrm{M}) \\ {[\text { evecs, evals] }=\underset{\operatorname{eig}(M)}{ }} \end{array}$ | Create the matrix $\left[\begin{array}{ll}1 & 2 \\ 3 & 4\end{array}\right]$ <br> The first row of M <br> Size of the matrix M <br> Create a $2 \times 3$ matrix of zeros or ones <br> 3 by 3 identity matrix (ones on diagonal, zeros everywhere else) <br> Sum of each column in matrix M ; $\operatorname{sum}(M, \mathcal{Q})$ gives sum across rows <br> Determinant of matrix M <br> Trace of matrix M <br> Transpose of matrix M <br> Eigenvalues of M <br> Eigenvalues and eigenvectors of M <br> Multiplication of matrix M and vector v |

| Random numbers |  |
| :---: | :---: |
| $\begin{array}{r} \operatorname{rand}(\mathrm{m} \\ \operatorname{randn}(\mathrm{m} \end{array}$ | m by n matrix of $\operatorname{Uniform}(0,1)$ random entries $m$ by $n$ matrix of $\operatorname{Normal}(0,1)$ random entries |
| Plotting |  |
| $\left.\begin{array}{r}\begin{array}{r}\text { figu } \\ \text { hold } \\ \text { plot }(\mathrm{x}, \mathrm{y})\end{array} \\ \text { xlabel(' } \mathrm{x} \text { '), ylabel('y'), title('Figure } \\ \text { subplot(rows, cols, nu }\end{array}\right)$ | Start a new figure <br> Put multiple plot commands on the same plot <br> Plot x vs. y <br> Label plot <br> Work in subplot \#num in a figure with rows by cols subplots <br> Plot a bar graph of vector v <br> Save the current figure to a pdf file (best for opening and printing out a graph by itself) Save the current figure to a jepg file (best for inserting a graph into a MSWord file) |
| Loops |  |
| $\begin{array}{r} >\ll=>=== \\ \text { if }(\text { test }) \text { action; end } \\ \text { if(test }) \text { action 1; else action 2; end } \\ \text { if(test 1) action 1; elseif(test 2) action 2; end } \\ \text { for(i=1:10) action; end } \\ \text { while(condition) action; end } \end{array}$ | Comparisons: less than, greater than, less than or equal to, greater than or equal to, equal to, and not equal to <br> Logical operators: and, or, not If test (e.g., $\mathrm{x}<0$ ) is true, do action (e.g., $\mathrm{x}=$ -x) <br> If test is true, do action 1, and if not, do action 2 <br> If test 1 is true, do action 1 , or if test 2 is true, do action 2 <br> For i equals $1,2,3, \ldots, 10$, do action <br> While condition (for example, $\mathrm{x}>=0$ \& $\mathrm{x}<=10$ ) is true, do action |
| Scripts and functions |  |
| $\begin{array}{r} \text { function [output] = myfun(input) } \\ \% \text { This function is for .. } \\ \text { global } \\ \text { clear } \\ \text { fprintf('Some words here' } \end{array}$ | create a function (saved in the file myfun.m) that takes input and gives output <br> Comments in function and script files: any text after the $\%$ is ignored by Matlab <br> Make x a global variable, so that a value assigned to x outside a function will be recognized in that function <br> Clear the value for the variable x ; writing clear clears values for all variables <br> Write Some words here in the command window |
| Oridinary differential equations |  |
| $[\mathrm{vt}, \mathrm{vx}]=$ ode45(@myodefun, [t0 tf], x0) where function $\mathrm{dxdt}=\operatorname{myodefun}(\mathrm{t}, \mathrm{x})$ dxdt $=\ldots$ | Numerically integrate myodefun, starting at x0, from time t0 to tf; this gives vector of values vx at the times in vector vt |

| Input/Output |  |
| :---: | :---: |
| For input and output within Matlab |  |
| save('fileName.mat','x','y' load('fileName.mat') | Save $x$ and $y$ in a file called fileName.mat (Matlab format) Upload the variables in fileName.mat (Matlab format) |
| For input and output between Matlab and spreadsheet programs (e.g., Excel) |  |
| $\mathrm{A}=\mathrm{dlm} r e a d(\text { 'fileName', '\t }$ <br> dlmwrite('fileName', A, '\} | Read the contents of fileName, where columns are separated by tabs (the delimiter can be anything, like ',' for commas, etc.), with the option of specifying the range as a third argument in the form of [firstRow firstCol lastRow lastCol], where counting starts with zero Save the matrix A in a file called fileName, with columns separated by tabs |
| For output to the command window |  |
| fprintf('some text') fprintf('some text $\backslash \mathbf{n}$ more text' fprintf('Time $=\mathbf{\%} \mathbf{f}^{\prime}, \mathrm{t}$ | Write some text in the command window Write some text, then more text on a new line Write Time $=4$ (or whatever number $t$ is) |
| For input from and output to text files |  |
| $\text { fid }=\text { fopen('fileName.txt', }$ | Open existent fileName.txt to read its contents and save the file's identifier as fid |
| $\mathrm{A}=\mathrm{fscanf}\left(\mathrm{fid}, ' \% \mathrm{f} \% \mathrm{f}^{\prime},[2 \mathrm{in}\right.$ | Take a file, identified by fid, with contents in the form of: <br> $0.1 \quad 0.2$ <br> $\begin{array}{ll}0.2 & 0.4\end{array}$ <br> $0.3 \quad 0.6$ <br> etc. <br> and store the contents in a 2-row matrix $A$ |
| $\text { fid }=\text { fopen('fileName.txt', ' }$ | Open new or existent fileName.txt to append to its contents and save the file's identifier as fid |
| fid $=$ fopen('fileName.txt', 'w') fprintf(fid, 'some text') <br> fclose(fid) | Open new or existent fileName.txt to write to it, erasing any current information, and save the file's identifier as fid Write some text in the file identified by fid; see above for more options <br> Close the file identified by fid |
| Use the Help Menu for more options and examples |  |
